

Eton **Water Supply Scheme**

Irrigation Price Path 1 July 2025 to 30 June 2029

We are developing a pricing proposal to submit to the Queensland Competition Authority (QCA) in late 2023.

The QCA will review this proposal in line with its requirements under the Queensland Competition Authority Act 1997 and any conditions set out in a Referral Notice, before making a recommendation back to the Queensland Government.

Scheme overview

63,263 ML in entitlements, with an average annual usage of 26,512 ML Related Eton distribution scheme run by local management authority

9 irrigation customers

Major assets

Kinchant Dam

Diversion pump stations 1, 2 and 3 Seven submersible pumps & Mirani Diversion Channel

Key operations and maintenance activities

Pump station refurbishments

Channel refurbishments to repair potential seepage

Preventative and planned / unplanned corrective maintenance mainly due to ageing assets

Pump station switchboard replacements

Pricing tariffs

Multiple tariff groups, including risk priority entitlements. Fixed (Part A) charges for medium priority entitlements and a variable (Part B) charge apply to non-risk entitlements, while risk entitlements have a 100 per cent variable charge.

How irrigation prices are set

A five-step price setting process leads to a four-year price path in each regulated scheme. There are differences in each scheme that impact pricing, such as risk entitlements, water harvesting or whether there is a scheme distribution system.

Price setting process

Step 1

Allocate revenue by charge type

(variable or fixed) Includes operating

expenditure and annuity revenue building blocks.

Step 2

Allocate fixed revenue to priority group allocation buckets

Allocation factors are relatively static, only changing when scheme operating parameters change. For example, when entitlements are converted from one priority to another.

Step 3

Allocate fixed revenue to priority group

Apply the fixed revenue allocators to set the revenue requirement by entitlement priority. For distribution schemes, revenue associated with customer loss entitlements are added here.

Step 4

Calculate cost reflective prices

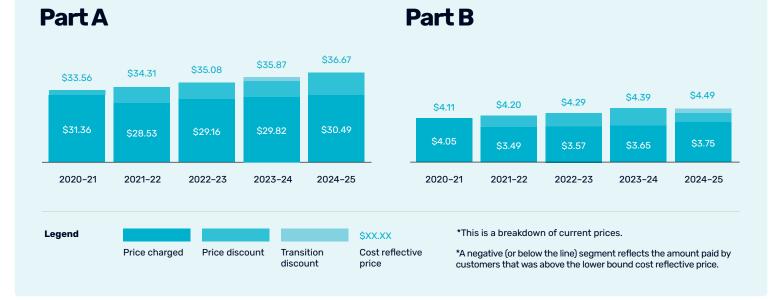

Cost reflective prices are set using assigned revenue and volumes to produce \$/ML prices.

Step 5

Determine recommended prices

Cost reflective prices are then smoothed across the four-year price path period to set target prices. Recommended prices are set with reference to current prices, target prices, and the price path principles.

Pricing breakdown High priority (HP)

Our commitment

Sunwater is committed to proactive and ongoing engagement with customers and acknowledges the feedback we have received over the past few years. We are rolling out a three-stage engagement plan to share information on current and draft prices and seek feedback on our proposal. As part of this, we will be holding customer forums in regional centres and ensuring that all project materials are available online.

Stage 1 Learn how irrigation prices are set March to May 2023

Learn how we are developing our pricing proposal and how you can be involved.

Stage 2 First look at draft future prices June and July 2023

We want your feedback

We will distribute Sunwater's proposed cost and price outlines for each scheme. We want your feedback, particularly in relation to:

- Electricity cost recovery
- Refreshing Service and Performance Plans.

Stage 3 Our pricing proposal August to October 2023

Having considered customer feedback, our final proposal will be shared.

Stay informed

We will update our website as the project progresses.
